No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                               This sequence represents the light chain variable region (VL) of murine anti-CD23 (FCERII) monoclonal antibody C11. The invention provides altered antibodies, such as chimeric or humanised antibodies (see A173262 and AAV32263), which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions (see AAV32264-59) to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of antiritis, lupus erythematosus, Habineovo's thyroiditis, multiple sclerosis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Slogren's syndrome, altergic asthma, acute asthmatic exacerbation, rhinitis, eczema, graftverbroticis asthma, acute asthmatics, bronchitis (particularly chronic bronchitis) or diabetes (particularly type I diabetes), and Brcell mallignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and determining the binding agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GIGCTTATGTICTGGATCTCTGGAGTCAGTGGGGGATATTGTGATAACCCAGGATGAACTC 122

This is the light (kappa) - chain variable (V) region of a mouse monoclonal antibody (MAD), 2E12, and is specific for an HIV-1 viral hantigen. It is used in the construction of a chimmeric MAD comprising heavy and light chains having murine V regions and human C regions. The chimmeric MADs are more effective than murine MAD 2E12 since they have an increased compactibility in humans. The heavy and light chain V-regions are joined by manipulating their respective joining (J) regions, to generate restriction enzyme reocgnition sites. The chimmeric MADs can be used as immuno- conjugates, in association with e.g. toxins for HIV treatment. They can also be used in diagnosis of HIV. See also AAQ12057-63. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct DR field.)

New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                        TCAGGAGTCTCAGACCGGTTTAGTGGCAGTGGGTCAGGCACAGATTTCACCCTGGAAATC 335

used

New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in fa smaller doses than antibodies that antagonise cocaine by simply binding.

WPI; 1998-077166/07

prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2AlO antibody (AAMAS909) represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2AlO has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                                                                              215
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  276 TCAGGAGTCTCAGACCGGTTTAGTGGCAGTGGGTCAGGCACAGATTTCACCCTGGAAATC 335

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                80
                                                                                                                                                                The present sequence represents the light chain of a catalytic antibody which is capable of degrading occaine. A series of cocaine transition state analogues (TSAS) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are use particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         156 ATCTCCTGCAGGTCTAGTAAGAGTCTCCTGTATAAGGATGGGAAGACATACTTGAATTGG

New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                          AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to decrade occaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody (AAW39808 represents the heavy chain) was identified using TSA2, and has a per minute Kcat of 0.016. The antibodies reduce the concentration of cocaine they are also used for treating addiction (by reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                              18; Page 73; 147pp; English

AW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3B9 antibody (AAM39806 represents the heavy chain) was identified using TSAl, which is an immunogenic conjugate of an identified using TSAl, which is an immunogenic conjugate of 0.11. The antibodies reduce the concentration of occaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                216 TITCIGCAGAGACCAGGACAATCTCCTCAGCTCCTGATGTATTTGATGTCCACCCGTGCA 275

The present sequence is a light chain variable region of IDI-1 an antidioty/pbc antibody/Ab2 monoclonal antibody (Mab) specific for PAb-421 which is an Ab1 mAb specific to the C-terminal DNA-binding domain of murine p53 protein. The Ab1 and Ab2 mAbs and peptides based on complementarity determining regions of light and heavy chain variable regions of these antibodies, are examples of active compounds useful in the diagnosis, prevention and treatment of SLE in humans

         prepared and used to immunise mice for production of hybridomas.

Catalytic antibodies were identified by their capacity to release 3H-
benzoic acid from 3H-phenyl occaine. The 6A12 antibody (AAW39807
represents the heavy chain) was identified using TSA1, which is an
immunogenic conjugate of a phosphate monoester transition state analogue.

Antibody 6A12 has a per minute Kcat of 0.072. The antibodies reduce the
concentration of cocaine in a subject, and are used particularly for the
treatment of an overdose. They are also used for treating addiction (by
reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                                          9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       80
                                                                                                    New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                         The present sequence represents the light chain of a catalytic antibody which is capable of degrading cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzolc acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are use particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved)

This sequence represents the light chain variable region (VL) of humanised anti-CD23 (FCERII) monoclonal antibody C11, composed of a human fragment of the light chain complementarity determining regions (see AAY32254 56) of murine antibody C11. The DNA was constructed by splice overlap PCR. The invention provides altered antibodies, such as chimarize or humanised antibodies, which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II determining regions to render them capable of binding to the CD23 type II complexity and heavy chain complementarity. CC molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple arthritis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulleraitive collitis, crohn's disease, Sjogran's syndrome, allergies, allergies asthma, cutte asthmatic exacerbation, rhinitis, eczema, graft-collitis, crohn's disease, Sjogran's syndrome, allergies, allergies casthma, cutte asthmatic exacerbation, rhinitis, eczema, graft-constrins) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions constructs and various ligands and determining the binding agents
                urticaria; nephrotic syndrome; glomerulonephritis;
hillammacory bowel disease; ulcerative colitis; Crohn's disease;
Sjogren's syndrome; allergy; asthma; rhinitis; eczema; insulitis;
graft-versus-host disease; COPD; bronchitis; diabetes; B-cell malignancy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cell receptor specific antibodies useful for treating e.g. arthritis,
   Hashimoto's thyroiditis; diabetes; uveitis; dermatitis; psoriasis;

comprising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin. The humanised antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting to treating HIV infection. The proteins of the invention are useful for inhibiting leukocyte trafficking, for treating CCR2 mediated disorders such as inflammatory disorder, autoimmune of disorders such as inflammatory disorder, autoimmune disorders such as rheumatorid arthritis and multiple sclerosis.

CCR2-mediated disorders such as inflammatory disorder, autoimmune of atterosensis and atherosclerosis, and for inhibiting restences. They are useful in therapy or disappnosis, and in the manufacture of a medicament for treating CCR-2 mediated disease. They are also useful for treating allegy, anaphylaxis, malignancy, chronic and acute confiammation, histamine and ISE-mediated allergic reaction, shock, stencesis, allograft rejection, fibrotic disease, asthma, inflammatory glomerulopathies, acquired immune deficiency syndrome (AIDS), restences associated with vascular intervention, including angioplasty and/or stent placement in a mammal, and inhibiting neolitimal hyperplasia of a vessel in a mammal, and inhibiting neolitimal hyperplasia of a vessel in a mammal, preferably associated with vascular intervention. The present sequence is mouse germline kappa in the chain variable (VK) region, 167/24

```
The invention relates to a novel chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CBO. The anti-CD40 antibody of the invention demonstrates cytostatic, virucide, antibacterial, immunostimulant and anti-HIV activities and may be useful for treating a hyperproliferative disorder souch as cancer, viral and bacerial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human anti-CD40 antibody variable region light chain protein of the invention.
                                                                                                                                                                                                           New chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40, useful for enhancing an immune response in a human, or treating cancer, HIV, neutropenia or

The monoclonal antibody or its fragments, following the stimulation of PTHrP has the following properties: (a) inhibite intracellular elevation of PTHrP) (b) inhibits the release of calcium from bone; or (c) inhibits elevation of blood ealcium content. The monoclonal antibody can be used in the treatment of hypercalcaemia, rheumatoid arthritis, cancer of bone including metastasis, pain, fracture, cachexia, diseases of teeth, periodontal diseases and gingiva, sepsis, systemic inflammencry response syndrome (SIRS) and hypophosphataemia. The present sequence represents a human printin manacory activities. The present sequence from the present

                                                                                                                                                                                                                                                                                                                                                                   properties: (a) inhibits intracellular elevation of CAMP; (b) inhibits the release of calcium from bone; or (c) inhibits elevation of blood calcium content. The monoclonal antibody can be used in the treatment of hypercalcaemia, rheumatoid arthritis, cancer of bone including metastrasis, pain, fracture, cachexia, diseases of teeth, periodontal diseases and gingiva, sepsis, systemic inflammatory response syndrome (SIRS) and hypophosphateaemia. It has antiarthritic, cytostatic and antiinflammatory activities. The present sequence represents a human PTHYP monoclonal antibody clone protein sequence from the present
